```
void setup()
{
    pinMode(13,OUTPUT); //Signale à l'Arduino que la connexion 13 doit pouvoir envoyer du courant digitalWrite(13,HIGH); //Demande à l'Arduino d'envoyer du courant dans la connexion 13
}
void loop()
{
}
When a pin is configured as an INPUT with pinMode(), and read with digitalRead(), the Arduino (Atmega) will report HIGH if:

a voltage greater than 3 volts is present at the pin (5V boards);
a voltage greater than 2 volts is present at the pin (3.3V boards);
```

Ard 1:

```
int vert = 8;
int orange = 9;
int rouge = 10;
void setup()
{
       pinMode(vert,OUTPUT);
       pinMode(orange,OUTPUT);
       pinMode(rouge,OUTPUT);
}
void loop()
{
       digitalWrite(vert,HIGH);
       delay(5000);
       digitalWrite(vert,LOW);
       digitalWrite(orange,HIGH);
       delay(1000);
       digitalWrite(orange,LOW);
       digitalWrite(rouge,HIGH);
       delay(5000);
       digitalWrite(rouge,LOW);
}
```

Ard 2:

```
int vert = 8;
int orange = 9;
int rouge = 10;
int vert_allumé=11;
int orange_allumé=12;
int rouge_allumé=13;
void setup()
{
       pinMode(vert,OUTPUT);
       pinMode(orange,OUTPUT);
       pinMode(rouge,OUTPUT);
       pinMode(rouge_allumé,INPUT);
       pinMode(orange_allumé,INPUT);
       pinMode(vert_allumé,INPUT);
}
void loop()
       if(digitalRead(orange_allumé)==HIGH);
       {
              digitalWrite(rouge,LOW);
               digitalWrite(vert,HIGH);
       if(digitalRead(rouge_allumé)==HIGH);
       {
              digitalWrite(vert,LOW);
               digitalWrite(orange,HIGH);
       if(digitalRead(vert_allumé)==HIGH);
       digitalWrite(orange,LOW);
       digitalWrite(rouge,HIGH);
       }
}
```
